

AdaptSeeker

Unlock the Internet

Staffing firms can mine the Internet for information using the Adapt Seeker module. This next generation of automated searching technology will search the web for resumes, companies, contacts, and other business intelligence.

By partnering with industry leaders infoGIST and Broadlook, Adapt Seeker decreases time spent searching for information – and increases the amount of time recruiters have available to use that information to drive business.

AdaptSeeker

WHAT IS AUTOMATED SEARCHING?

Automated searching allows users to set up searches that run unattended to find and download documents containing key words and phrases. infoGist and Broadlook have taken this concept a step further and created an industry-specific data mining tool that finds information - such as resumes and sales/marketing data – and downloads it into Adapt.

infoGIST's automated resume searching can be launched from within Adapt to search multiple resume sources simultaneously and quickly. By automatically sifting through payboards, freeboards and independent sites across the web, infoGIST broadens the scope of a search and increases the chance of filling a job while saving recruiters countless hours of time.

Broadlook provides a revolutionary tool that searches the internet for information on marketing, sales leads, and networking opportunities. This allows your sales team to spend valuable time selling, not searching.

INFOGIST, BROADLOOK, AND ADAPT

With Adapt Seeker, staffing firms will discover that finding people and managing relationships is easier than ever. Recruiters can locate resumes and perform mass imports directly into Adapt, making it a snap to contact and track qualified applicants. They can use Seeker to stay on top of contacts and candidates with reminders, and to find the best prospects for your candidates easily. This creates placement opportunities and improves productivity.
